## **THE LASER SOLUTION FOR WHITE SPOTS AND SKIN DISCOLORATION**

You should know about the XTRAC laser.

The same technology successfully used in ophthalmology to correct myopia can recover your skin color quickly and efficiently, restoring your confidence in your appearance. Ask your doctor about the revolutionary XTRAC laser treatment.

## *XTRAC laser treats white spots and skin depigmentation*

If surgical scars, stretch marks, burns, injury from trauma or laser skin resurfacing have left your skin with unsightly white spots, now you can put an end to your embarrassment.

The revolutionary XTRAC laser has proved to be efficient for the treatment of these spots, known as leukoderma, depigmentation or loss of pigment.

In a few brief sessions, XTRAC can help to restore the natural pigmentation of your skin.

### **How is XTRAC different?**

XTRAC is light years ahead of other treatments for white spots, as it uses a laser beam carefully focussed through a sophisticated fiberoptic system. XTRAC can recover your skin color quickly and effectively using just the necessary doses to stimulate the melanocytes without exposing the healthy skin.

### **What is the treatment like?**

The treatment is done once or twice a week. Each session lasts 5 minutes on average without any risk of skin burn. As it is completely painless it can be recommended for children.

### **How can I know if XTRAC treatment is applicable to my white spots?**

Only your doctor is able to evaluate if XTRAC is the best option in your case.
